curl … install.sh | bash -s -- [options]
podman or docker found?
no
yes
stop: install one first
resolve the release: --version, or the latest from the GitHub API
download compose files, edumatcher.sh and .env template from that release's tag into --dir
create data/ and config/; write .env only if absent, then set EM_VERSION, GHCR_OWNER
--config?
a file
a name
no
copy to config/engine_config.yaml, set EM_CONFIG_FILE
set EM_CONFIG
--no-start?
yes
no
done; start later with ./edumatcher.sh start
./edumatcher.sh start (pulls the images)
